

Correction to *Lancet Planet Health* 2023; 7: e271–81

Masselot P, Mistry M, Vanoli J, et al. Excess mortality attributed to heat and cold: a health impact assessment study in 854 cities in Europe. *Lancet Planet Health* 2023; 7: e271–81—In this Article, an error in the analysis code affected death rates used for individuals aged 85 years and older, affecting reported excess death rates. This issue was flagged in an expression of concern while we decided how best to correct the record. We have now corrected the appendix, figures, tables, and text (to aid transparency, because there are a large number of changes, these are also highlighted in an additional appendix). The overall effect of the correction is to bring down all impact measures by around 35%, but all locations are affected similarly. The authors' interpretation therefore remain unchanged. Original and corrected versions of the code can be found here. These corrections have been made as of July 2, 2024.
