## **1. eMethods.**

### **1.1 Description of the data**

A detailed description of the mortality and environmental data used in the present study was provided in this section. As mentioned before, Mortality data and environment data were obtained from the Multi-country Multi-city (MCC) Collaborative Research Network (<https://mccstudy.lshtm.ac.uk/>). Generally, we have examined associations between mortality and many environmental exposures in the previous studies, including temperature variability (TV),(Guo et al. 2016) ambient temperature,(Gasparrini et al. 2015) particulate matter,(Liuet al. 2019) ozone,(Vicedo-Cabreraet al. 2020) nitrogen dioxide(Menget al. 2021) and carbon monoxide (Chenet et al. 2021). The current MCC network covers 760 locations from 47 countries or regions. For some countries, daily minimum temperatures and maximum temperatures (used to calculate inter-day and intra-day TV) were not available. Thus, we collected weather data from the ECMWF Reanalysis 5th Generation (ERA5) land dataset at  $0.5^\circ \times 0.5^\circ$  spatial resolution (<https://cds.climate.copernicus.eu/cdsapp#!/home>) for these countries.

For locations with daily minimum temperatures and maximum temperatures, we also checked the missing values and replaced all the observations of weather data when the missing rate was over 80% using the ERA5 dataset. For locations with a missing rate lower than 80%, we replaced the missing values on each location using the ERA5 dataset. For mortality data, two types of missing values were identified: missing at random and missing not at random. For the first type, missing values only could be observed on random days during the study period. For the second type, mortality data could be missing for several entire months in specific year on some locations. In that case, we excluded relative years containing non-random missing values on these locations. Finally, 758 locations included in this study all have a coverage over 2 years. The overall missing rate for all-cause mortality, cardiovascular mortality, respiratory mortality,

and minimum/maximum temperature was 0.001%, 0.08%, 0.14%, and 0.00014%, respectively.

## 1.2 Relationship with pre-existing indices

Diurnal temperature range (DTR) and temperature change between the neighbouring days (TCN) were previously used as indicators for intra-day and inter-day temperature (Huet al. 2021; Vicedo-Cabrera et al. 2016). Our newly defined intra-day and inter-day TV could be good proxy for DTR and TCN. For intra-day TV and DTR, we could give the relationship with the following equation:

$$TV_{intra-day,0-L} = \sqrt{\frac{\sum [(T_{l,min} - \bar{T}_l)^2 + (T_{l,max} - \bar{T}_l)^2]}{2L+1}} = \sqrt{\frac{\sum (T_{l,max} - T_{l,min})^2}{2(2L+1)}} = \sqrt{\frac{\sum (DTR_l^2)}{2(2L+1)}}$$

For inter-day  $TV_{0-1}$  and TCN, their relationship could be expressed as:

$$TV_{inter-day,0-1} = \frac{TCN}{\sqrt{3}}$$

It would be difficult to express the relationship between inter-day TV and TCN. Nevertheless, the decomposition made the percentage change in mortality risk and attributable fraction of the two indices comparable.

## 1.3 Calculation of attributable fraction (AF)

We calculated the attributable fractions (AF) using the following equations:

$$RR_{i,t} = \exp(\beta \times (TV_{i,t} - TV_{i,ref}))$$

$$AN_{i,t} = Number\ of\ deaths_{i,t} \times (RR_{i,t} - 1)/RR_{i,t}$$

$$AN = \sum_i \sum_t AN_{i,t}$$

$$AF = \frac{AN}{Total\ number\ of\ deaths}$$

where  $\beta$  is the pooled effect estimates associated with per 1 °C increase of inter-day TV or intra-day TV,  $TV_{i,t}$  is the inter-day TV or intra-day TV for city  $i$  on day  $t$ ,  $TV_{i,ref}$  is the minimum inter-day TV or intra-day TV (defined as the reference TV or the counterfactual

scenario),  $RR_{i,t}$  is the cumulative relative risk of inter-day or intra-day TV in city  $i$  on day  $t$ ,  $AN_{i,t}$  is the attributable number of deaths for city  $i$  on day  $t$ , and  $AF$  is the attributable fraction calculated at the global level. The AFs at the country level were calculated using the same method. Additionally, 95% confidence interval (CI) was calculated using the 95% CI of pooled effect estimates.
